g unit notes

---

the arrowed lines indicate signal flow

the auto panner signal flow can be reversed to make a x-fader, ie: plug two signals into the outputs and tap the input as your output

on the upper two rows of jacks, the second row are all outputs except the last jack on the far right which is the third mixer input

on the upper two rows of jacks the first row is inputs only

piezo mic can be tapped from either of the boosts if nothing is plugged into the input of the boost

g unit runs on 12v center positive 200ma. Higher ma is fine, the synth will only draw the power that is needed. Lower voltages can be used too down to 7v should be fine always center positive.

If the synth gets wet, unplug immediately if its on, or if its off let it dry out before turning it on.

For any service requirements please don't hesitate to get in touch with me at [info@twintropiques.com](mailto:info@twintropiques.com)

Have Fun!

Nicolas
